

### FEATURES

- High slew rate:** 9 V/ $\mu$ s
- Wide bandwidth:** 4 MHz
- Low supply current:** 250  $\mu$ A/amplifier maximum
- Low offset voltage:** 3 mV maximum
- Low bias current:** 100 pA maximum
- Fast settling time**
- Common-mode range includes V+**
- Unity-gain stable**

### APPLICATIONS

- Active filters**
- Fast amplifiers**
- Integrators**
- Supply current monitoring**

### GENERAL DESCRIPTION

The OP282/OP482 dual and quad operational amplifiers feature excellent speed at exceptionally low supply currents. The slew rate is typically 9 V/ $\mu$ s with a supply current under 250  $\mu$ A per amplifier. These unity-gain stable amplifiers have a typical gain bandwidth of 4 MHz.

The JFET input stage of the OP282/OP482 ensures bias current is typically a few picoamps and below 500 pA over the full temperature range. Offset voltage is under 3 mV for the dual and under 4 mV for the quad.

With a wide output swing, within 1.5 V of each supply, low power consumption, and high slew rate, the OP282/OP482 are ideal for battery-powered systems or power restricted applications. An input common-mode range that includes the positive supply makes the OP282/OP482 an excellent choice for high-side signal conditioning.

The OP282/OP482 are specified over the extended industrial temperature range. The OP282 is available in the standard 8-lead narrow SOIC and MSOP packages. The OP482 is available in PDIP and narrow SOIC packages.

<sup>1</sup> The input bias and offset currents are characterized at  $T_A = T_J = 85^\circ\text{C}$ . Bias and offset currents are guaranteed but not tested at  $-40^\circ\text{C}$ .

## ABSOLUTE MAXIMUM RATINGS

Table 2.

| Parameters  | Ratings           |
|---|-------------------|
| Supply Voltage  | $\pm 18\text{ V}$ |
| Input Voltage   | $\pm 18\text{ V}$ |
| Differential Input Voltage <sup>1</sup>                               | 36 V              |
| Output Short-Circuit Duration   | Indefinite        |
| Storage Temperature Range<br>P-Suffix (N), S-Suffix (R), RM Packages  | -65°C to +150°C   |
| Operating Temperature Range<br>OP282G, OP282A, OP482G                 | -40°C to +85°C    |
| Junction Temperature Range<br>P-Suffix (N), S-Suffix (R), RM Packages | -65°C to +150°C   |
| Lead Temperature (Soldering 60 sec)                                   | 300°C             |

<sup>1</sup> For supply voltages less than  $\pm 18\text{ V}$ , the absolute maximum input voltage is equal to the supply voltage.

Stresses above those listed under Absolute Maximum Ratings may cause permanent damage to the device. This is a stress rating only; functional operation of the device at these or any other conditions above those indicated in the operational section of this specification is not implied. Exposure to absolute maximum rating conditions for extended periods may affect device reliability.

## THERMAL RESISTANCE

$\theta_{JA}$  is specified for the worst-case conditions, that is, a device in socket for CERDIP and PDIP.  $\theta_{JA}$  is specified for device soldered in circuit board for SOIC\_N or MSOP packages.

Table 3.

| Package Type                  | $\theta_{JA}$ | $\theta_{JC}$ | Unit |
|-------------------------------|---------------|---------------|------|
| 8-Lead MSOP [RM]              | 206           | 44            | °C/W |
| 8-Lead SOIC_N (S-Suffix) [R]  | 157           | 56            | °C/W |
| 14-Lead PDIP (P-Suffix) [N]   | 83            | 39            | °C/W |
| 14-Lead SOIC_N (S-Suffix) [R] | 104           | 36            | °C/W |

## ESD CAUTION

**ESD (electrostatic discharge) sensitive device.** Charged devices and circuit boards can discharge without detection. Although this product features patented or proprietary protection circuitry, damage may occur on devices subjected to high energy ESD. Therefore, proper ESD precautions should be taken to avoid performance degradation or loss of functionality.

## APPLICATIONS INFORMATION

The OP282 and OP482 are dual and quad JFET op amps that are optimized for high speed at low power. This combination makes these amplifiers excellent choices for battery-powered or low power applications that require above average performance. Applications benefiting from this performance combination include telecommunications, geophysical exploration, portable medical equipment, and navigational instrumentation.

### HIGH-SIDE SIGNAL CONDITIONING

Many applications require the sensing of signals near the positive rail. OP282s and OP482s were tested and are guaranteed over a common-mode range ( $-11 \text{ V} \leq V_{\text{CM}} \leq +15 \text{ V}$ ) that includes the positive supply.

One application where this is commonly used is in the sensing of power supply currents. This enables it to be used in current sensing applications, such as the partial circuit shown in Figure 44. In this circuit, the voltage drop across a low value resistor, such as the  $0.1 \Omega$  shown here, is amplified and compared to  $7.5 \text{ V}$ . The output can then be used for current limiting.

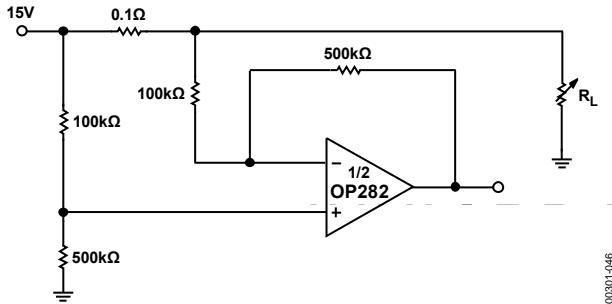

Figure 44. High-Side Signal Conditioning

### PHASE INVERSION

Most JFET input amplifiers invert the phase of the input signal if either input exceeds the input common-mode range. For the OP282/OP482, a negative signal in excess of  $11 \text{ V}$  causes phase inversion. This is caused by saturation of the input stage leading to the forward-biasing of a gate-drain diode. Phase reversal in OP282/OP482 can be prevented by using Schottky diodes to clamp the input terminals to each other and to the supplies. In the simple buffer circuit in Figure 45, D1 protects the op amp

against phase reversal. R1, D2, and D3 limit the input current when the input exceeds the supply rail. The resistor should be selected to limit the amount of input current below the absolute maximum rating.

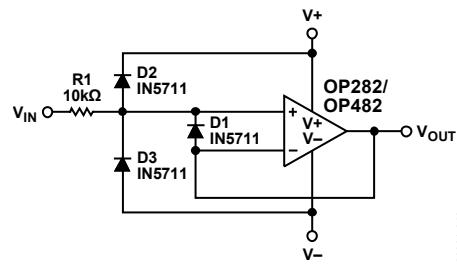

Figure 45. Phase Reversal Solution Circuit

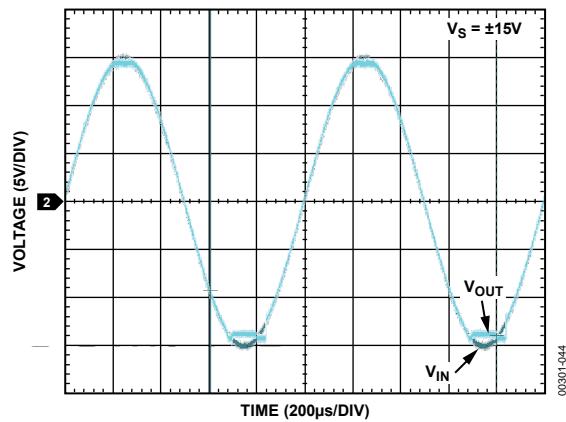

Figure 46. No Phase Reversal

### ACTIVE FILTERS

The wide bandwidth and high slew rates of the OP282/OP482 make either one an excellent choice for many filter applications.

There are many active filter configurations, but the four most popular configurations are Butterworth, elliptic, Bessel, and Chebyshev. Each type has a response that is optimized for a given characteristic as shown in Table 4.

Table 4.

| Type              | Selectivity | Overshoot | Phase  | Amplitude (Pass Band) | Amplitude (Stop Band) |
|-------------------|-------------|-----------|--------|-----------------------|-----------------------|
| Butterworth       | Moderate    | Good      |        | Maximum flat          |                       |
| Chebyshev         | Good        | Moderate  |        | Equal ripple          |                       |
| Elliptic          | Best        | Poor      |        | Equal ripple          |                       |

## PROGRAMMABLE STATE VARIABLE FILTER

The circuit shown in Figure 47 can be used to accurately program the Q, the cutoff frequency ( $f_c$ ), and gain of a two-pole state variable filter. OP482s have been used in this design because of their high bandwidths, low power, and low noise. This circuit takes only three packages to build because of the quad configuration of the op amps and DACs.

The DACs shown are used in the voltage mode; therefore, many values are dependent on the accuracy of the DAC only and not on the absolute values of the DAC's resistive ladders. This makes this circuit unusually accurate for a programmable filter.

Adjusting DAC 1 changes the signal amplitude across R1; therefore, the DAC attenuation times R1 determines the amount of signal current that charges the integrating capacitor, C1. This cutoff frequency can now be expressed as

$$f_c = \frac{1}{2\pi R_1 C_1} \left( \frac{D1}{256} \right)$$

where  $D1$  is the digital code for the DAC.

The gain of this circuit is set by adjusting  $D3$ . The gain equation is

$$\text{Gain} = \frac{R4}{R5} \left( \frac{D3}{256} \right)$$

DAC 2 is used to set the Q of the circuit. Adjusting this DAC controls the amount of feedback from the band-pass node to the input summing node. Note that the digital value of the DAC is in the numerator; therefore, zero code is not a valid operating point.

$$Q = \frac{R2}{R3} \left( \frac{256}{D2} \right)$$
